APPLICATION

Mid-Level Software Consultant, Comsysto Reply, Zagreb

Dear Comsysto Reply team,

I'm applying for the **Mid-Level Software Consultant** position in your Zagreb office.

While I was still studying at FER I joined a small startup building a sports management platform, and I've been there four years. My first year was on the data side, where I designed and implemented a **sport diagnostic system** in Python, and a computer vision project for estimating athletes' jump height became a paper I published at [IEEE STAR 2023](#) as first author. For the last three years I've worked on our **Flutter** app for iOS and Android. I took over as team lead when the previous lead moved to another role, and I mentor the student on our team.

What I have enjoyed most about this work is solving the problem behind a task rather than simply implementing what was written in a ticket. Requirements were often unclear, so I learned to identify what a feature was actually meant to achieve before estimating it, suggest better business rules when the original ones did not make sense, and redesign workflows that would otherwise create problems later. I also noticed that inconsistencies between design and development were causing unnecessary rework, so I worked with our designer to create and implement a **design system**, which allowed us to build new screens roughly three times faster.

Questioning requirements and then convincing people of the alternative is most of what I understand consulting to be, and doing that with a client rather than a colleague is the step I want to take. Four years in a small team on one product gave me depth and a lot of autonomy but little breadth, which is why a consultancy with a mentor and a range of projects appeals to me more than another product team. Picking things up quickly is the part I worry about least: when I moved from Python to Flutter I was shipping production code within days.

I also work deliberately with **AI tooling**. Claude Code is my main environment, with a plugin and skills setup I've tuned over time, and I keep looking for new things to add to my workflow.

My depth is Flutter rather than Spring or React. If a Flutter engagement is where I'd add the most value I'd gladly take one, though I'd rather come in as a consultant than a pure implementer.

I'd be glad to talk.

Kind regards,
Ivan Lokas
